The ideas behind this are definitely cute and worthy of exploration. But the product isn't it. First, the AI is so bad you can consistently win in 6 moves. Try it. 1. e4 Nf6 2. e5 Nd5 3.Bf1 Nf4 4. Qf3 Ng6 5. Bxf7 Kxf7 6. Qxf7 1-0. This is a combination of: 1. The AI is really, really bad. Maybe 800 Elo or something. 2. The AI (apparently) always does the same move in a given situation, no randomization (which is kind of ironic in a game about probabilities). 3. The AI never does quantum moves. So playing against the computer is pointless. Playing against people is also nearly impossible. So that leaves academic exploration of the game mechanics, but this also falls short because there's very little information about how the mechanics actually work. I've went through the tutorial and some online materials; and while the basic ideas are clear, I've seen some behavior I can't explain, and there's no technical reference I can use to determine if my logic is wrong, or there is a bug in the engine. This relates to the point that I've seen the designer claim that there's a complex (the a+bi kind) inner representation of the state, but I've seen no technical specification to back this, so it seems like a marketing gimmick. As it currently stands, it can be a nice free demo. But if they're charging money, I expect these two issues to be resolved - a decent AI, and more information on mechanics.
